

# The agent said "done." The order was still pending.

FaultLab runs a tool-using agent against controlled service failures, reproduces the mistake, proposes a bounded repair, and tries to break that repair before keeping it.

## INJECTED FAULTS

Lost response after commit · delayed completion · stale read · transient failure. At most two per scenario.

## — THE LOOP

# Find the failure, reproduce it, repair it, then try to break the repair.

- Model roles propose
- Fixed software executes, checks and decides
- The model proposing a repair cannot award itself a passing score.
